

# **HCAL – SiPM upgrade requirements**

**Workshop in Trieste on June 2-4 2008**

## HCAL current baseline readout

### *Inside the magnet:*

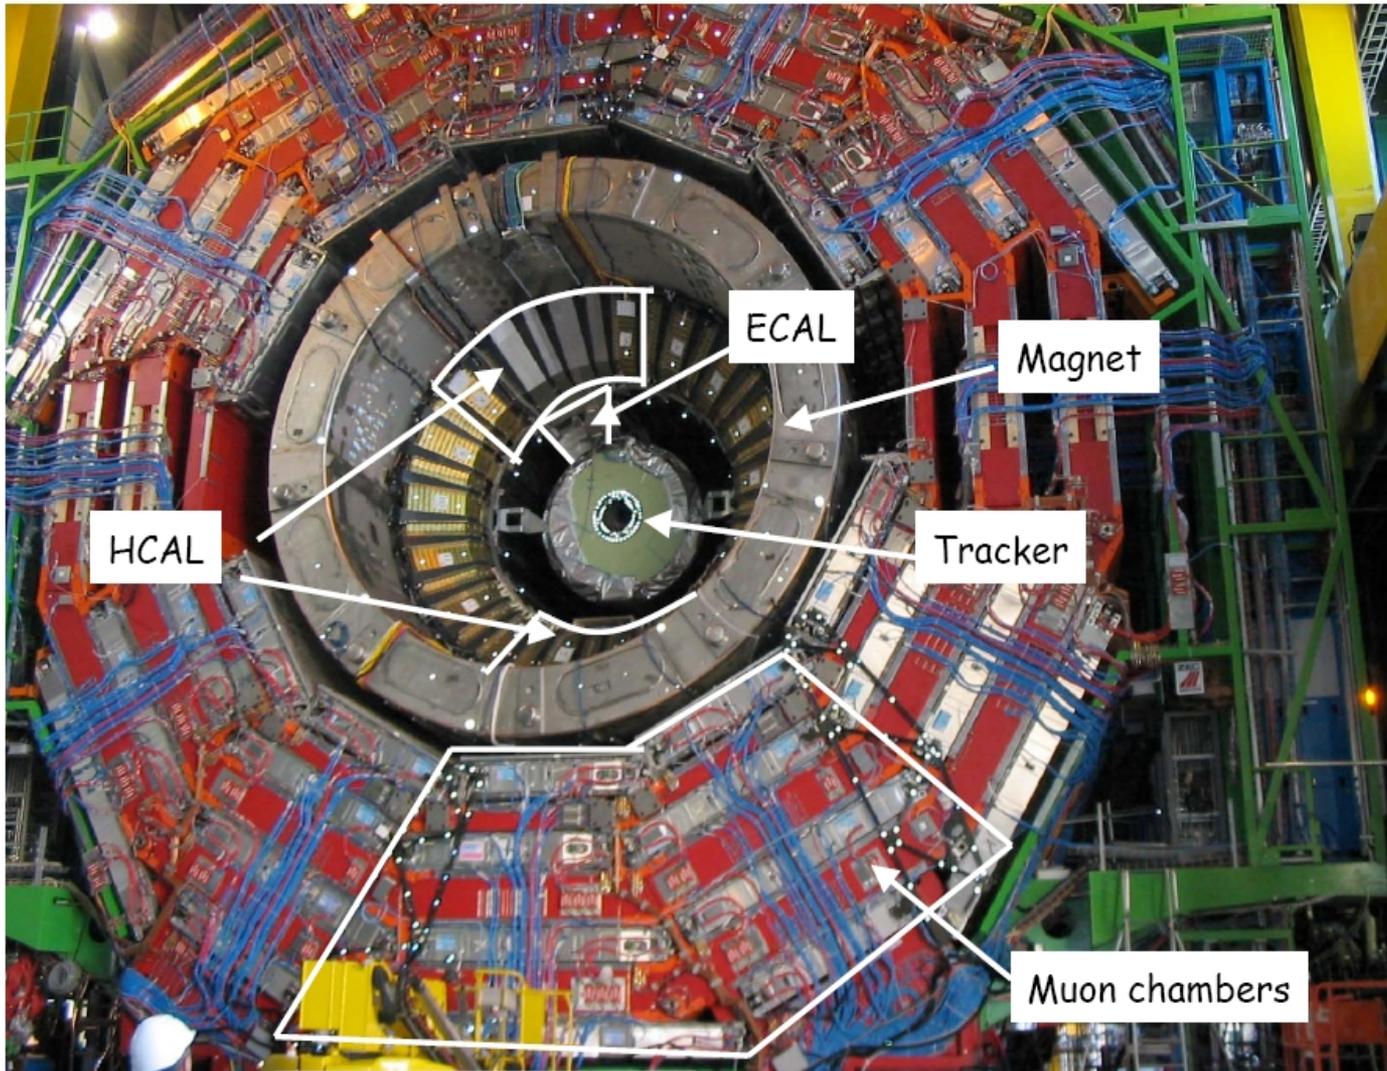

- HB 144 x 19 channel HPDs (16 layers)
- HE 144 x 19 channel HPDs (16 layers)

### *Outside the magnet:*

- HO 132 x 19 channel HPDs (1-2 layers)
- HF 1800 one inch PMTs.

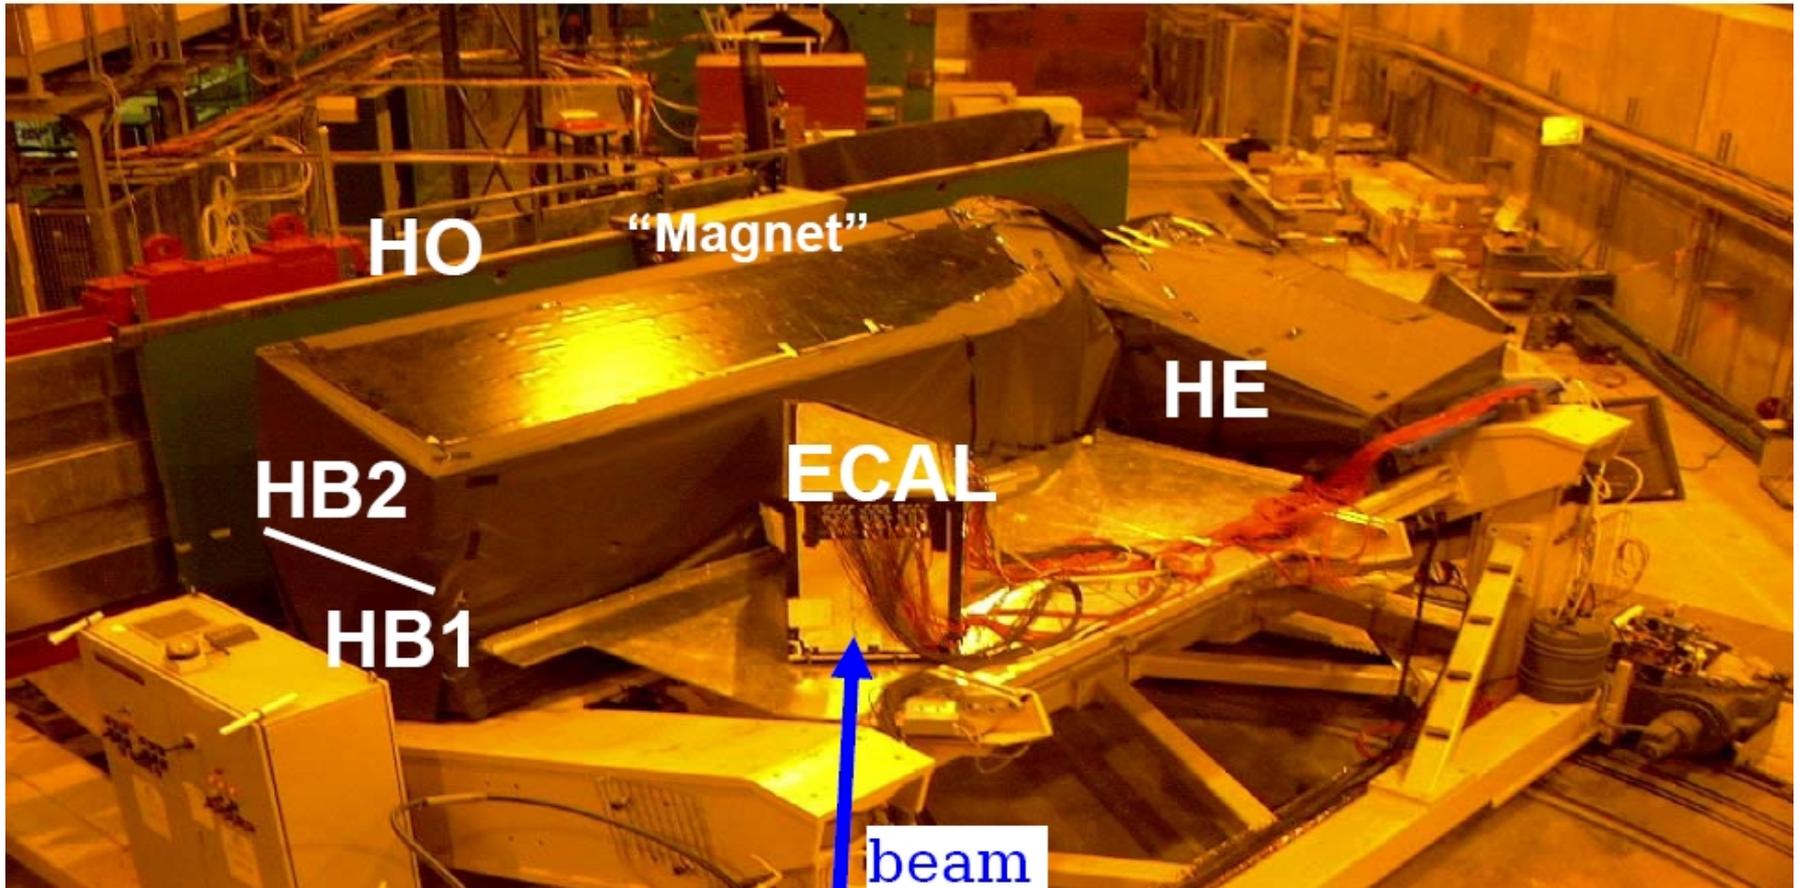

# CMS Ring YB0

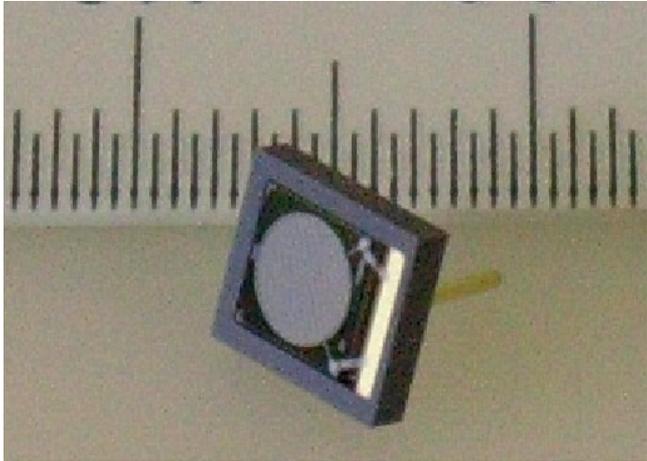

# Test Beam setup

➤ Due to the cosine effect of the Angle we have lowest light in YB1 (YB0 has 2 layers)

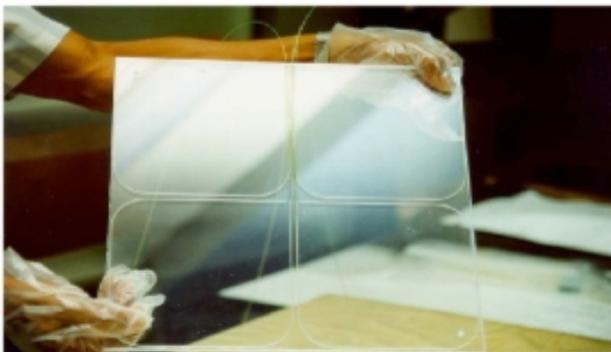

# Developed; Custom FBK SiPM

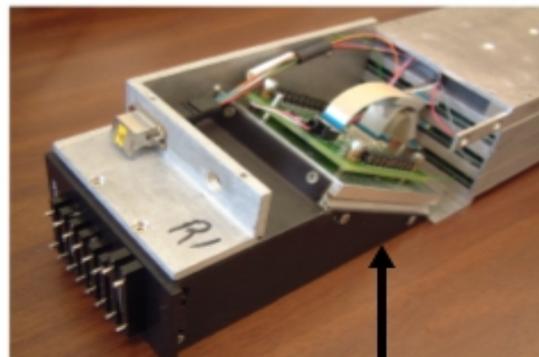

# HO with SiPM readout

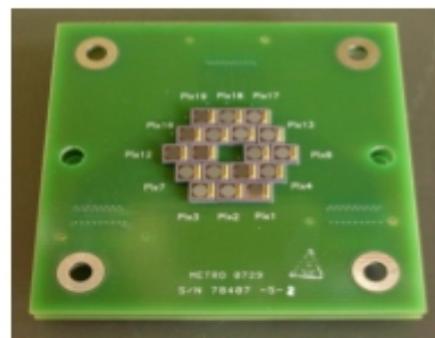

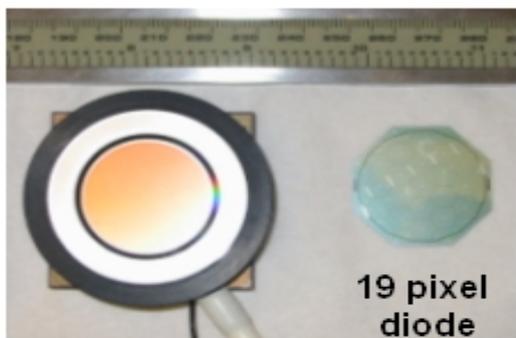

Single layer behind the magnet  
4 fibers per tile

HCAL readout module  
4 fibers per tile

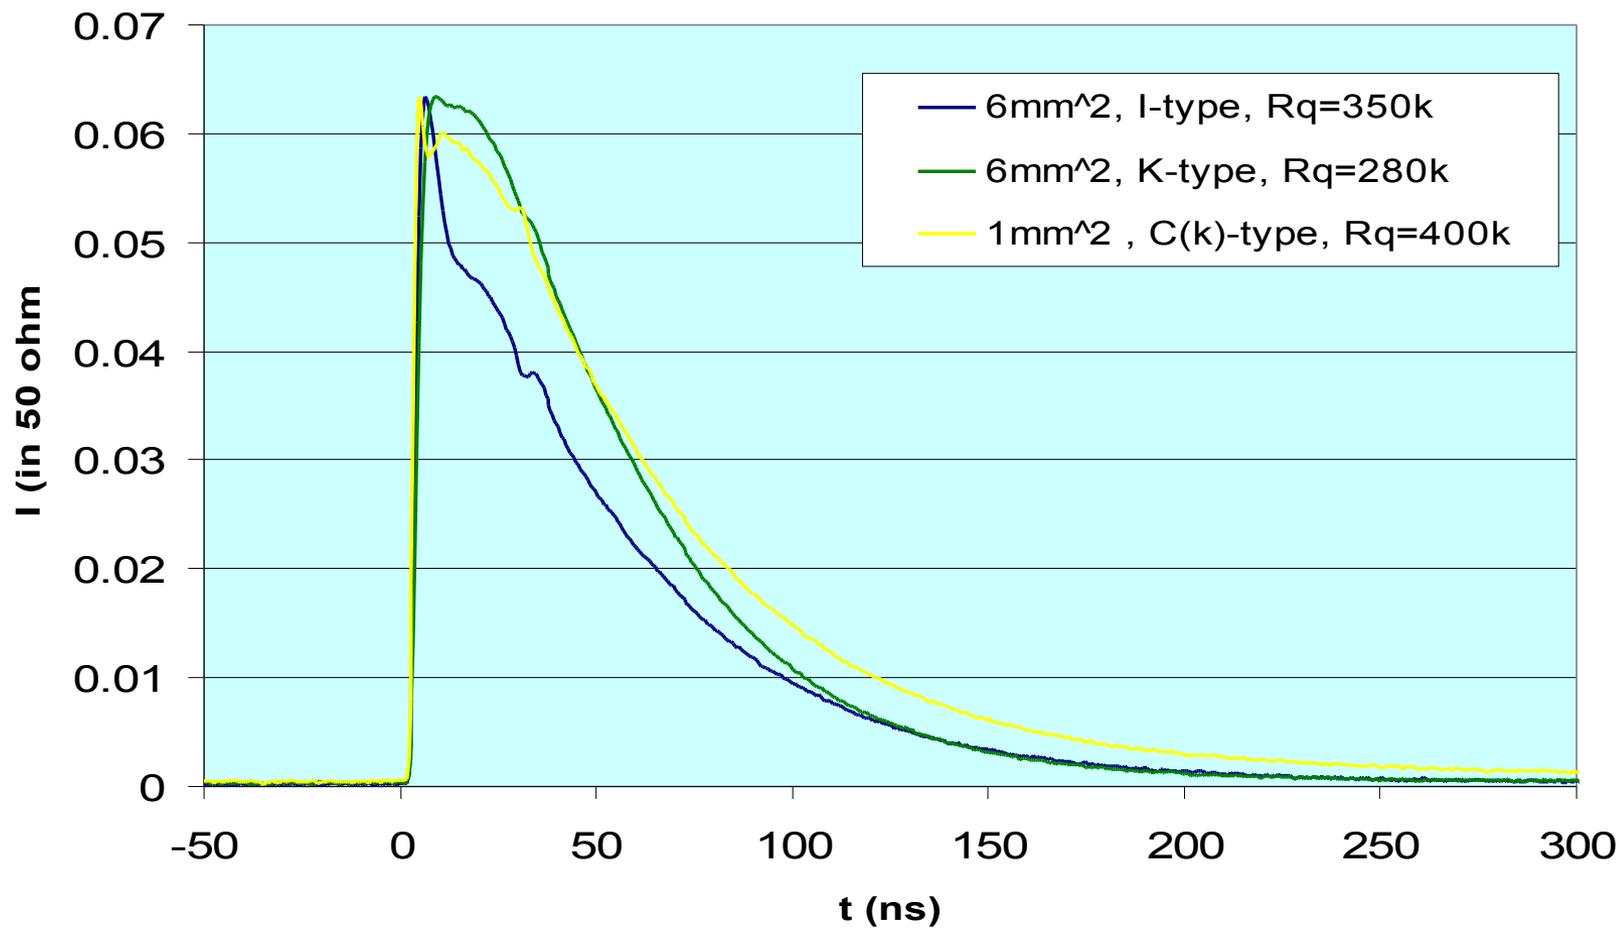

Simple replacement of HPD with SiPMs

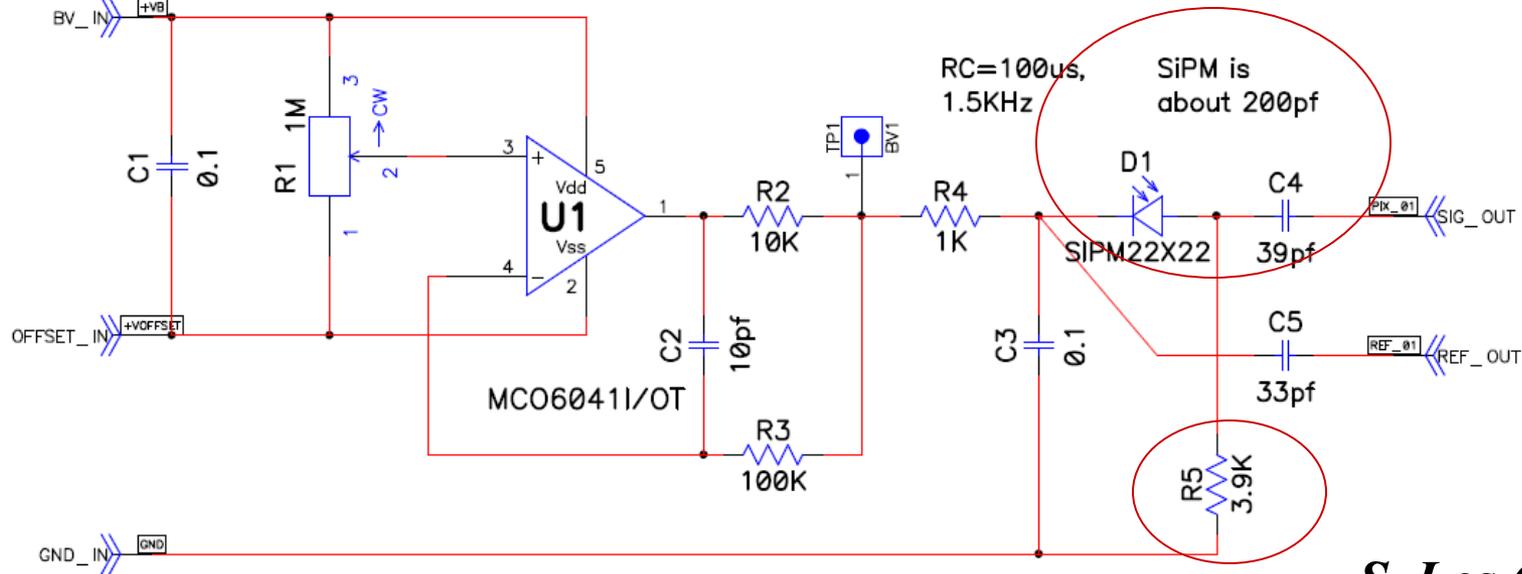

# Typical SiPM pulse

# SiPM-QIE Interface Circuit diagram

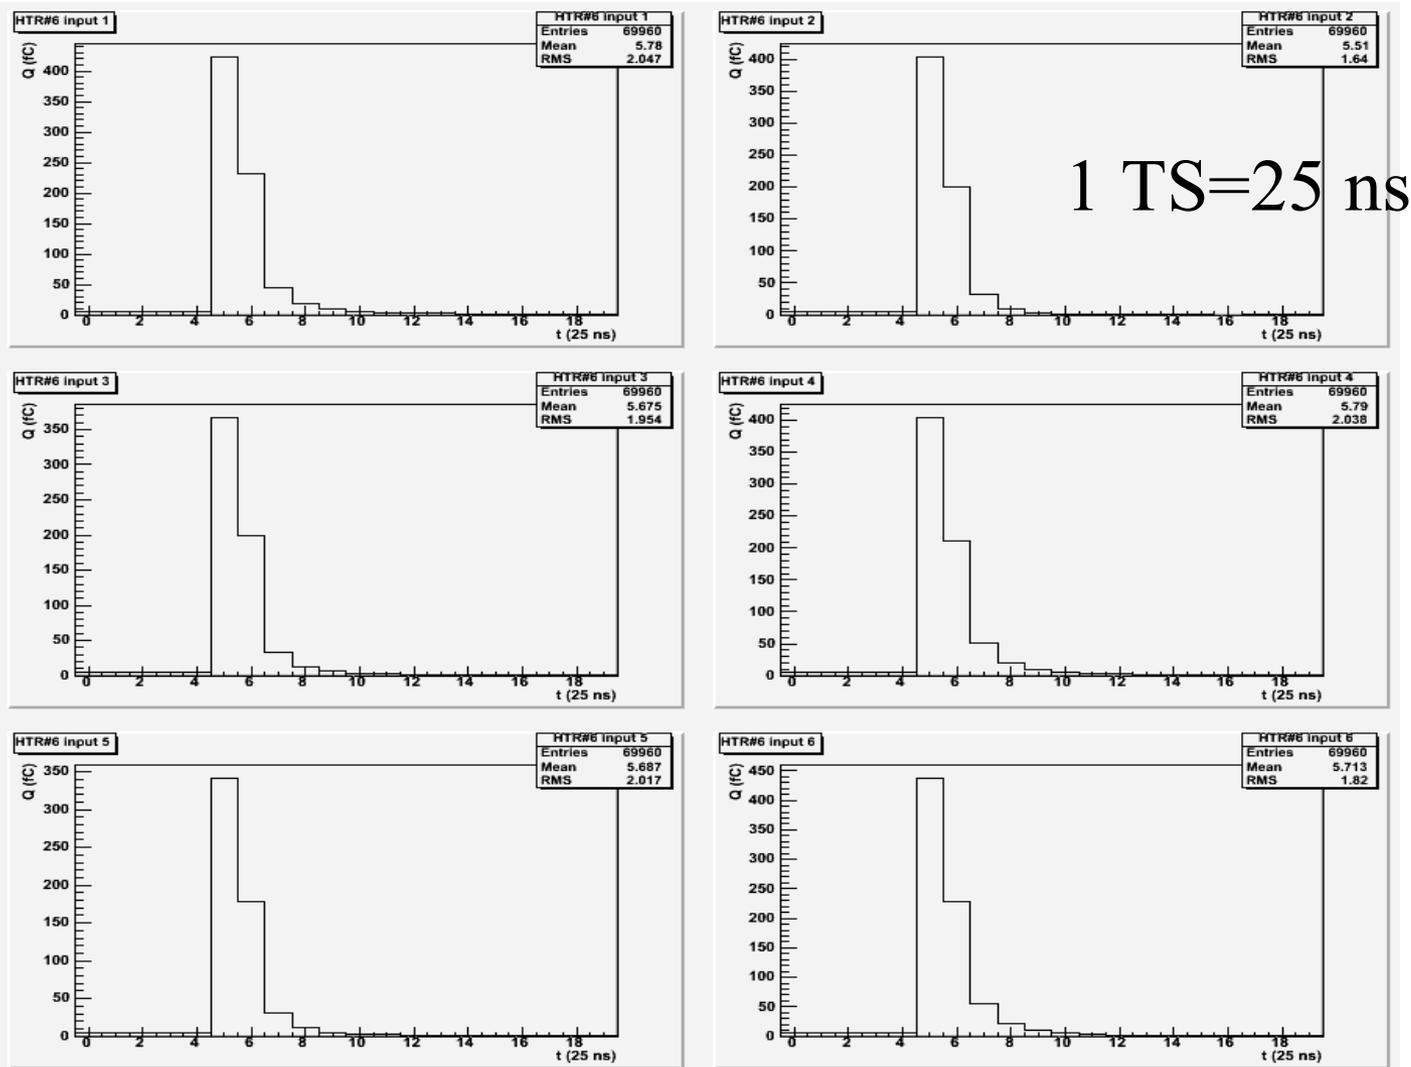

*S. Los (FNAL)*

- To match the gain of the readout we used a factor of 5 lower couple capacitor
- Using R5 we hope to shape the pulse shape and cancel the tails

# Pulse shape after QIE

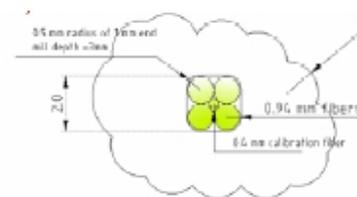

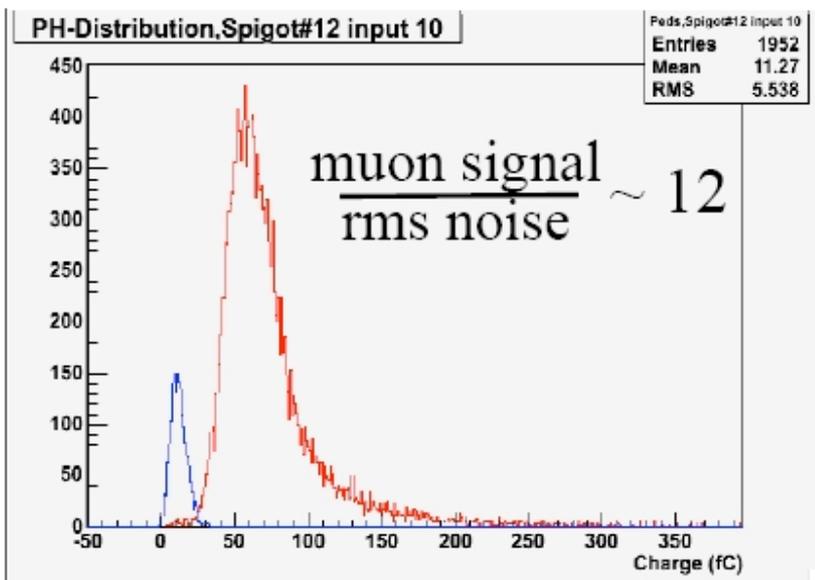

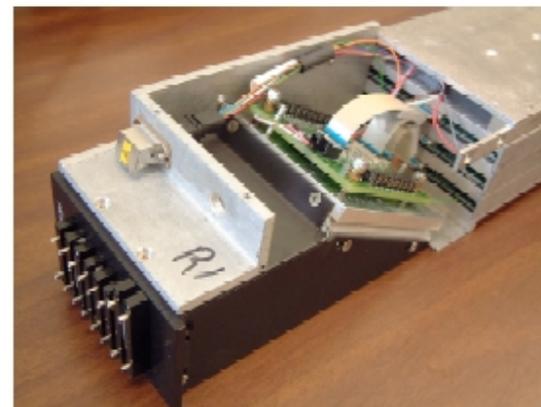

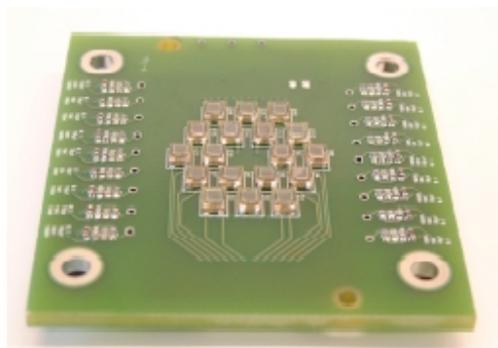

# 2006 First Test Beam results

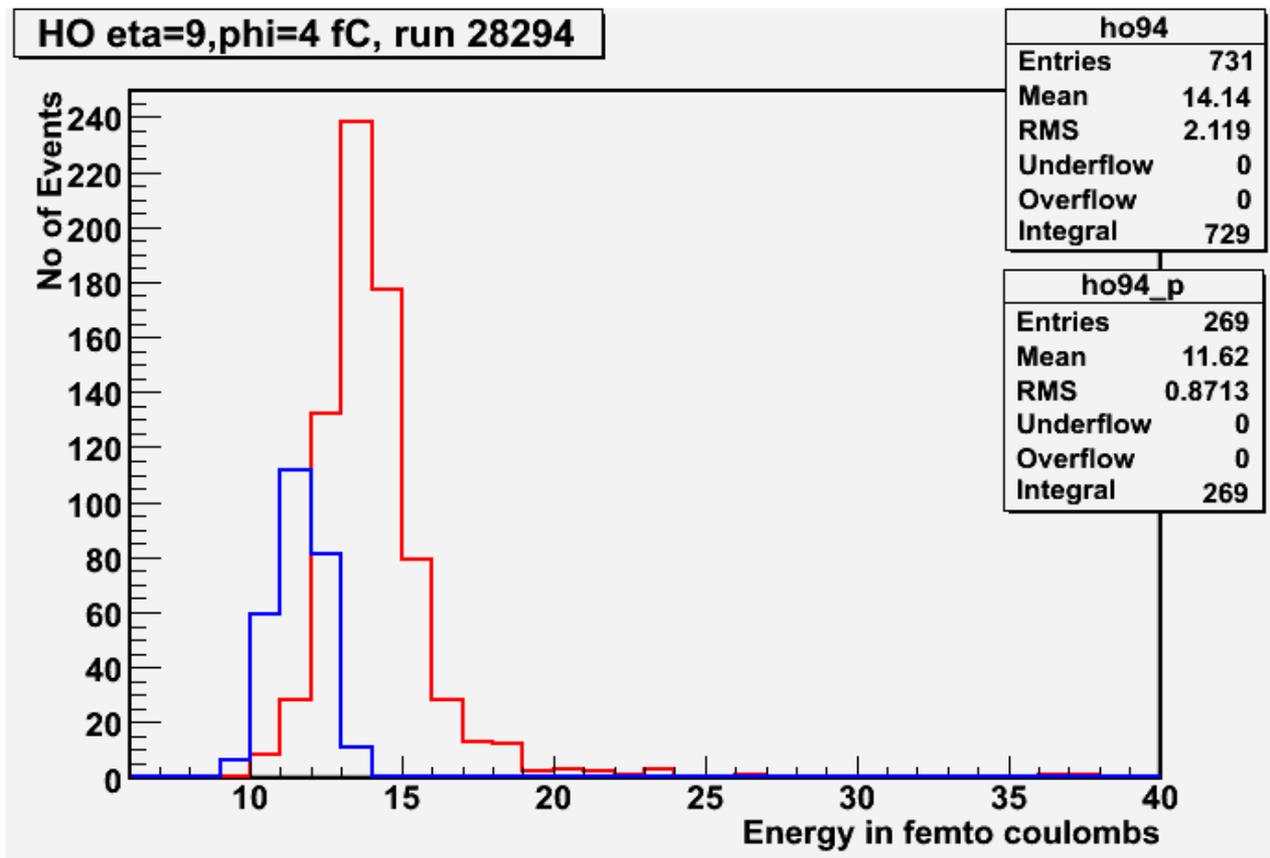

2.1 mm x 2.1 mm

CPTA 2006  
1764 pixels

# HPD muon in HO YB1

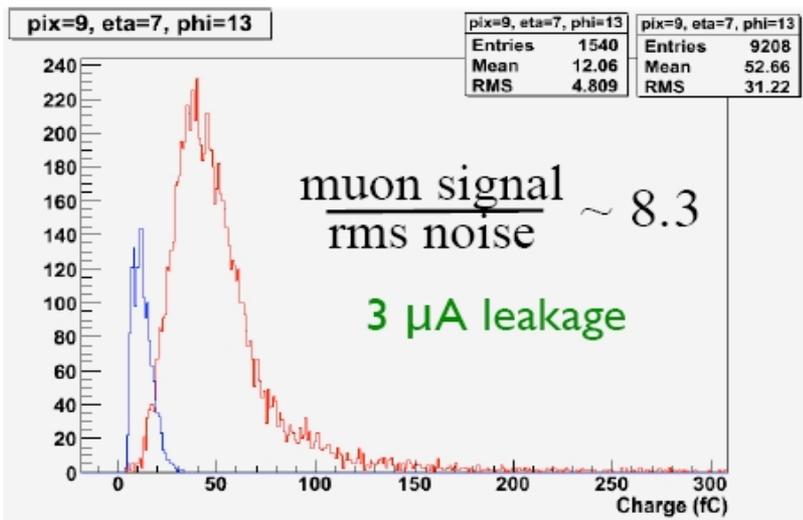

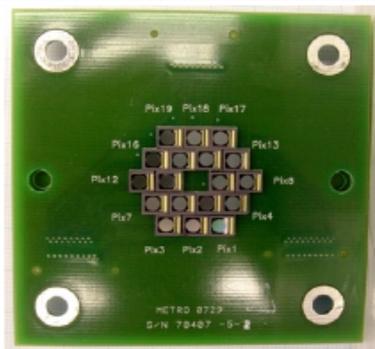

# 2007 Test beam FBK custom diode

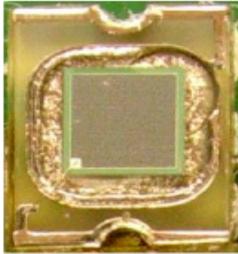

2.8 mm diam.

IRST  
1250 pixels  
(Used cells)

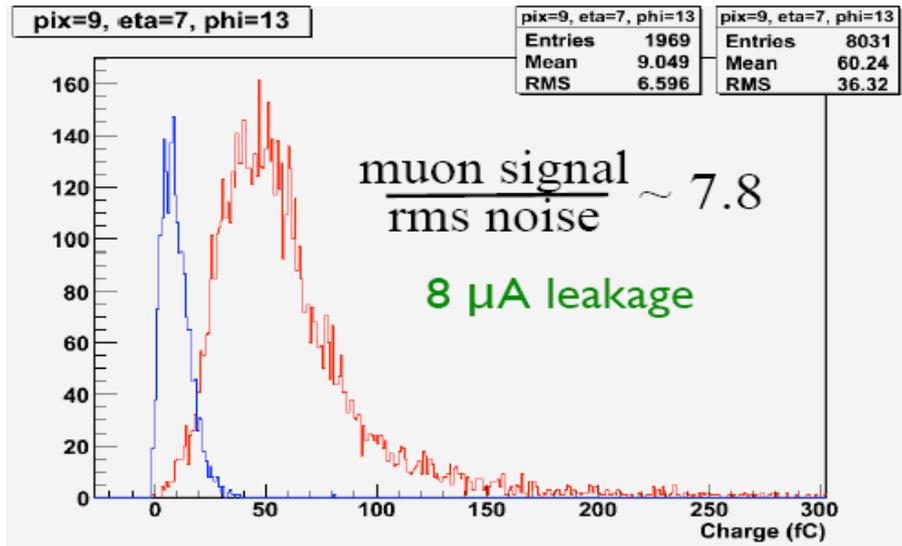

# 2007 Test beam CPTA 2x2 mm diode

2.1 mm x 2.1 mm

We used light mixer

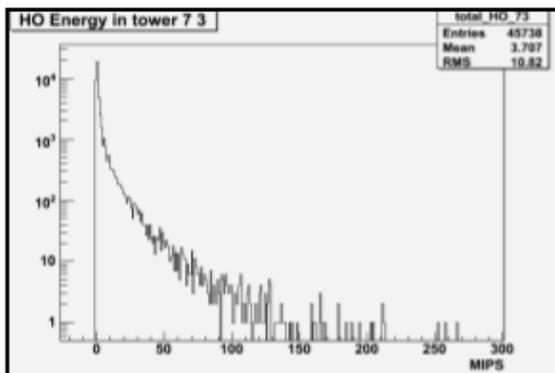

CPTA 2007  
1750 pixels

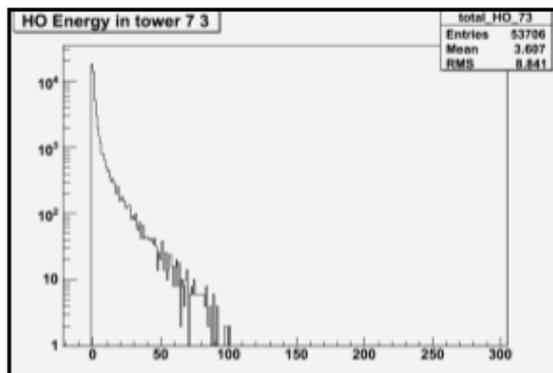

# Linear range is worst then HPD

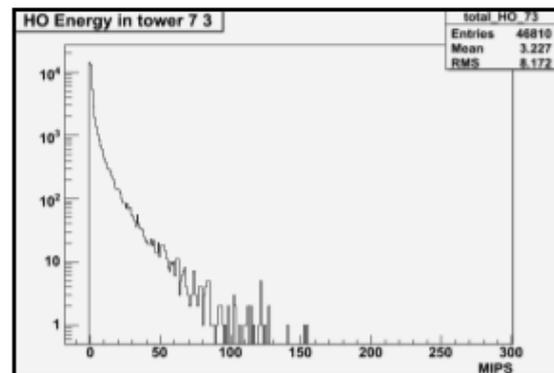

HPD, 300 GeV pions in center tower

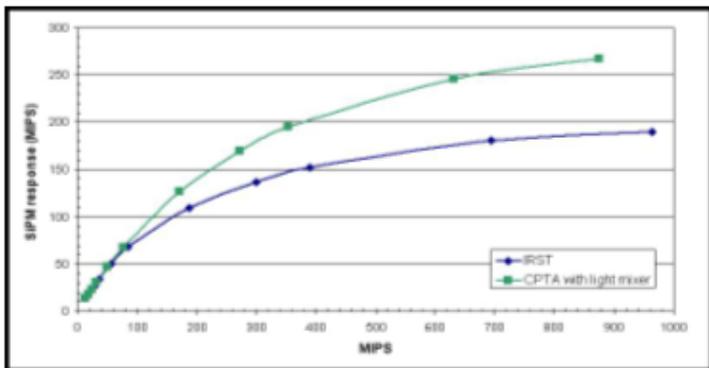

IRST, 300 GeV pions in center tower

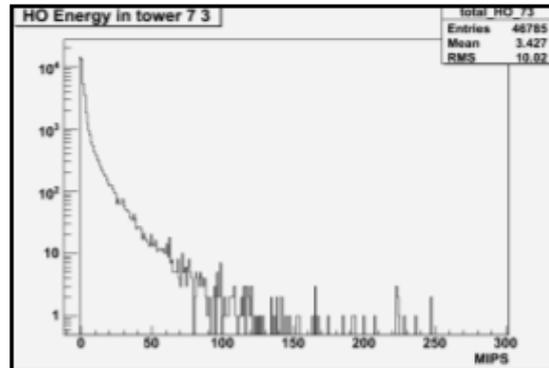

CPTA with light mixer, 300 GeV pions in center tower

Measured Non linearity due to limit # of cells

SiPM with Non linearity correction

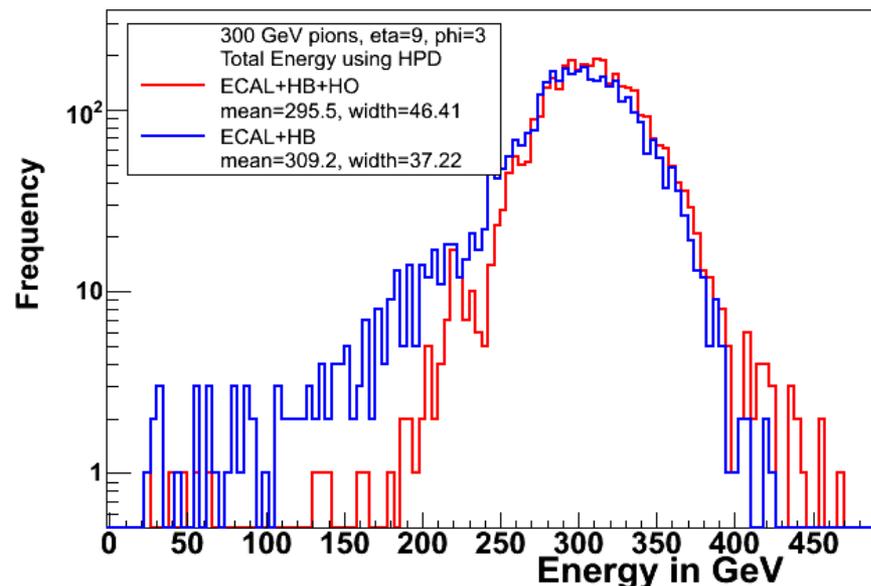

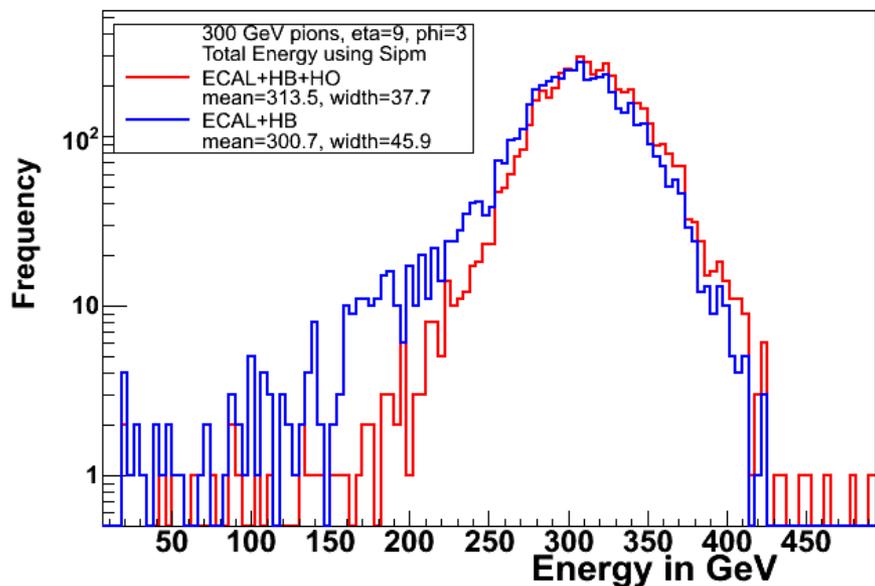

# 300 GeV pion resolution in 3x3 towers

## ECAL + HCAL

SiPM

HPD

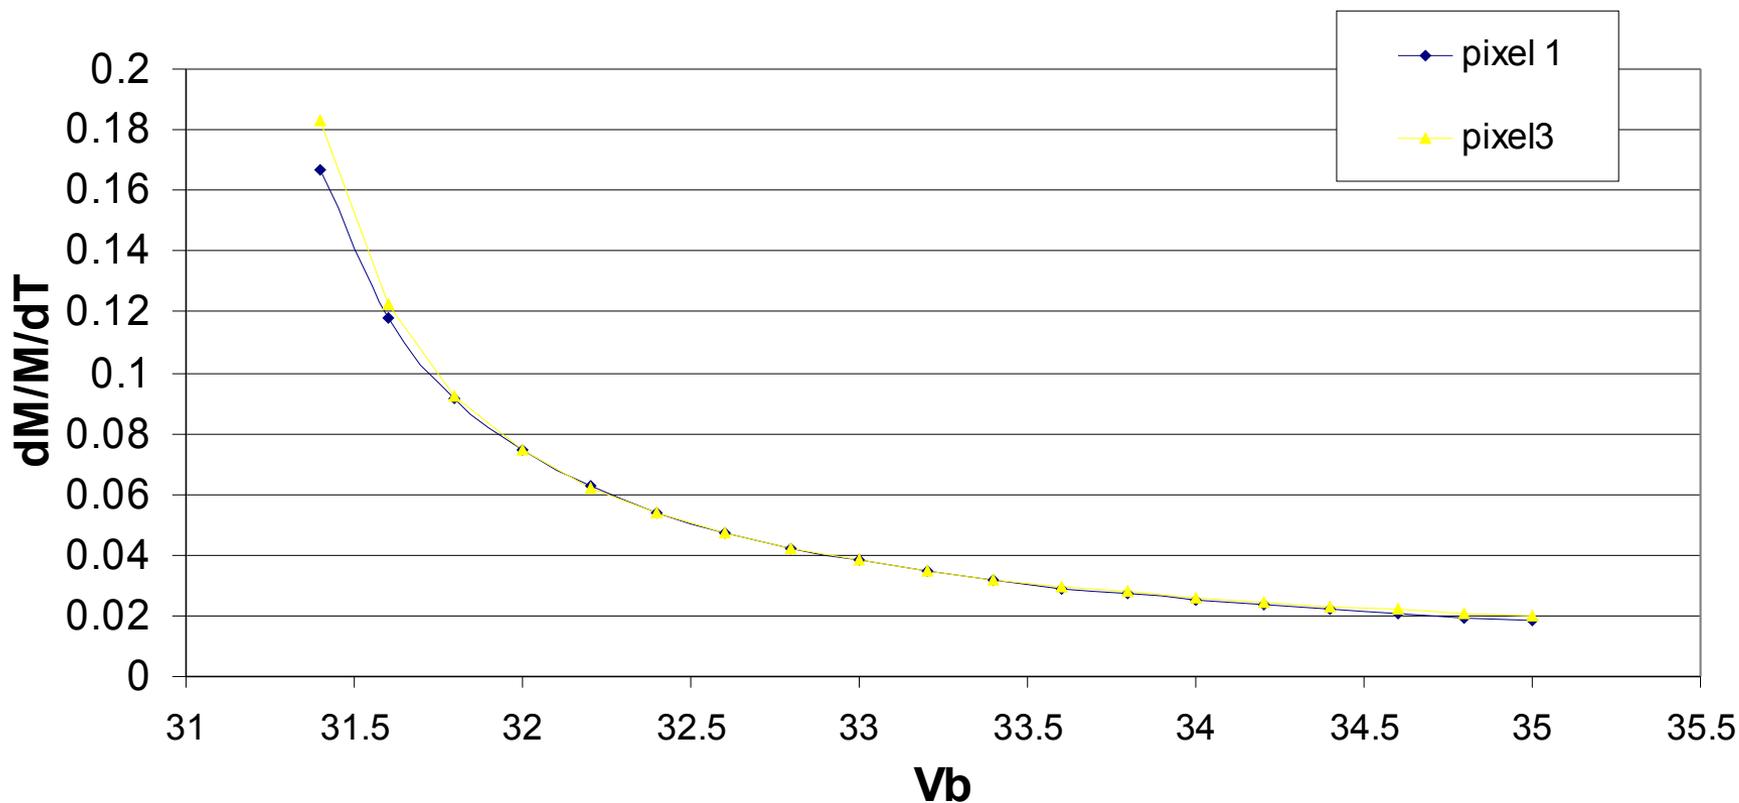

**No indication that late showers give worst resolution as baseline HPD**

# Measured Temperature coefficient

gain change with Temp  
 $V_b=30.5$  at 21 C,  $V_b=31.2$  at 30C

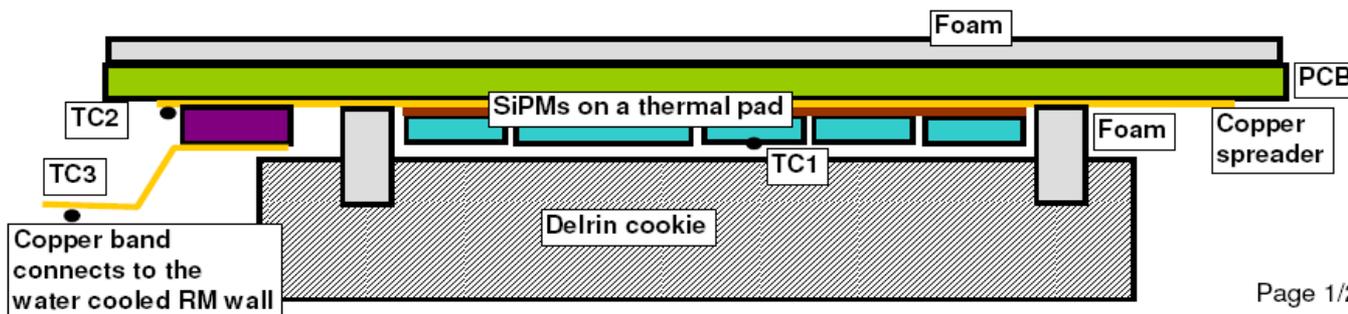

# Production Cooling and stabilization

## SiPM Cooling with the Thermoelectric Coolers for HCAL/CMS

S.Los Jan. 11, 2008

Thermal conductivity	$W \times m^{-1} \times K^{-1}$	Range
Copper	400	
Aluminum	238	
Silicon	150	
Ceramic ( $Al_2O_3$ )	16	16-40
Glass	1.4	
Fiberglass	1	
Delrin	0.375	
Silicone Ceramic filled	1.4	
ZnO thermal grease	0.8	
Polyurethane foam	0.03	
Air	0.025	

Thermal resistance		K/W
Delrin cookie	(10mm thick, 32mm $\varnothing$ )	33
Ceramic body of SiPMs	(1.5mm thick, 28mm $\varnothing$ )	0.15
Thermal Pad	(0.2mm thick, 28mm $\varnothing$ )	0.23
Copper Spreader	(0.1mm thick, 30mmWx50mmL)	42
2 oz copper fill	0.07mm thick, 40mmx40mm)	36
Aluminum spreader	(1mm thick, 30mmWx50mmL)	7
Copper strap (heat sink)	(1mm thick, 12mmWx40mmL)	8
PCB radial loss resistance	(1.6mm thick, 32mm $\varnothing$ , 10mm)	62
Back foam pad	(1mm thick, 75mmx75mm)	6
Back foam pad	(2mm thick, 40mmx40mm)	42

# Radiation study in October 2007

## Radiation tests at Mass. General Hospital 240 MeV protons

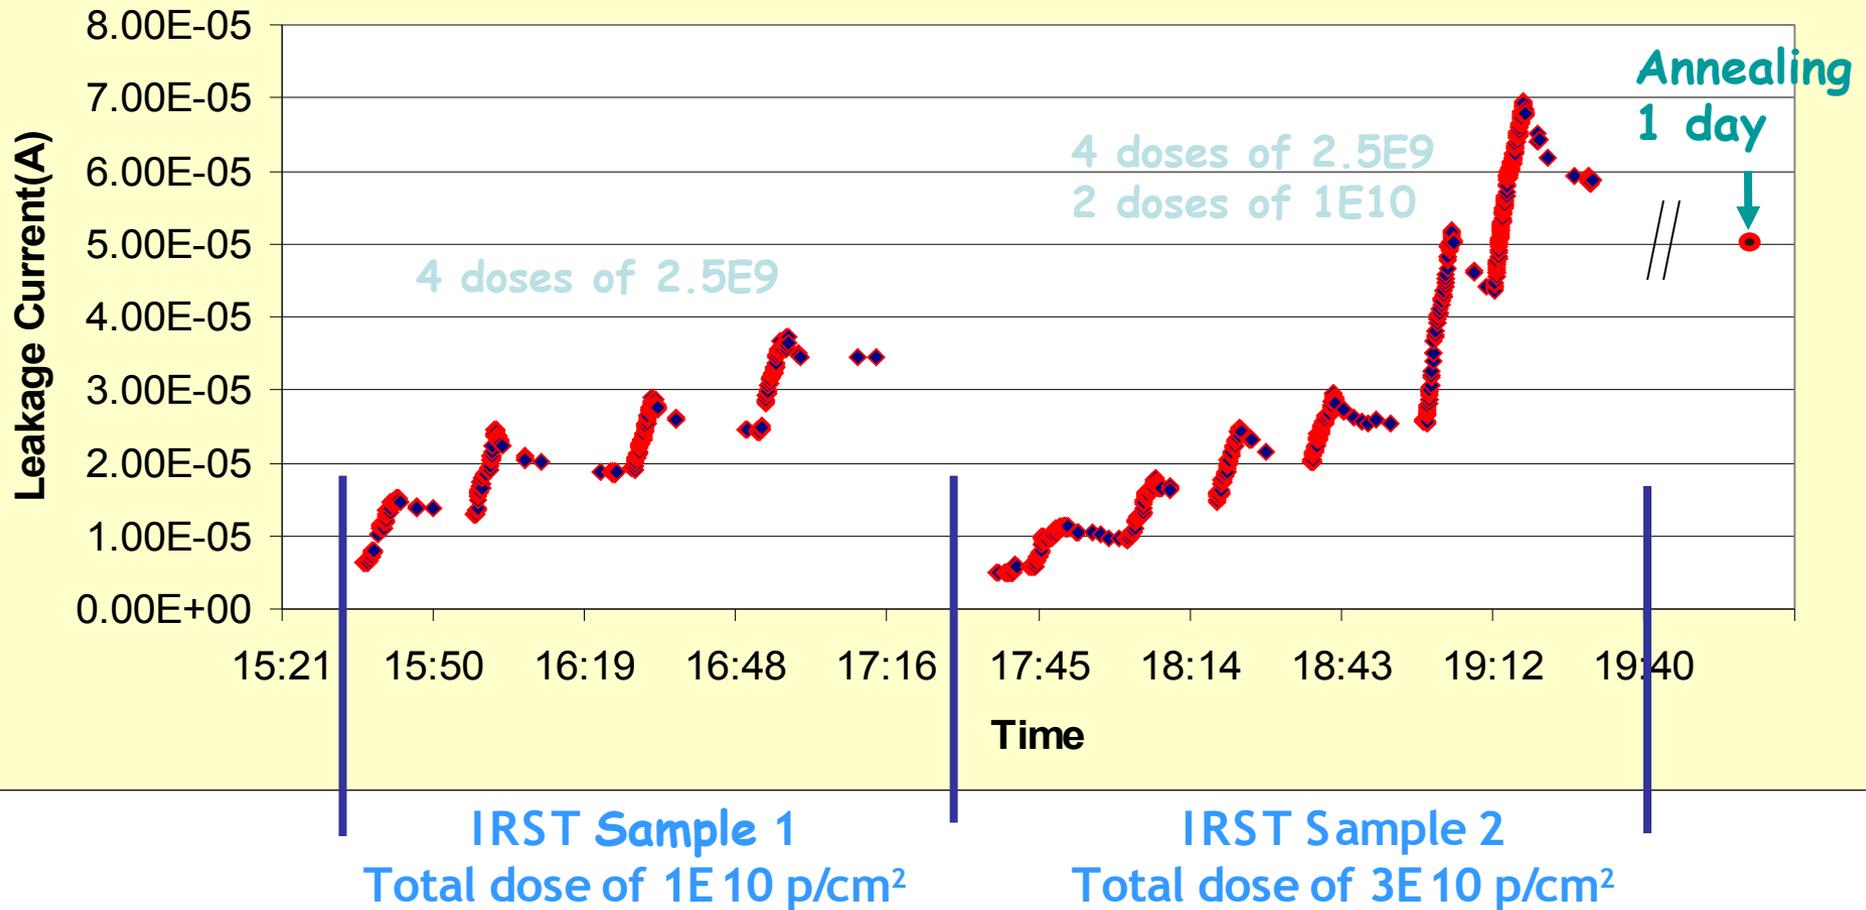

Board no.	SiPM	Fluence (protons per cm <sup>2</sup> )
1	CPTA reference	0
1	CPTA 1 × 1 mm <sup>2</sup>	10 <sup>10</sup>
1	HC 3 × 3 mm <sup>2</sup>	10 <sup>10</sup>
1	FBK 1 × 1 mm <sup>2</sup>	10 <sup>10</sup>
2	CPTA reference	0
2	CPTA 1 × 1 mm <sup>2</sup>	3 × 10 <sup>10</sup>
2	HC 3 × 3 mm <sup>2</sup>	3 × 10 <sup>10</sup>
2	FBK 1 × 1 mm <sup>2</sup>	3 × 10 <sup>10</sup>
3	CPTA reference	0
3	CPTA 2.1 × 2.1 mm <sup>2</sup>	10 <sup>10</sup>
3	FBK 2.8 mm	10 <sup>10</sup>
3	FBK single pixel	10 <sup>10</sup>
4	CPTA reference	0
4	CPTA 2.1 × 2.1 mm <sup>2</sup>	3 × 10 <sup>10</sup>
4	FBK 2.8 mm	3 × 10 <sup>10</sup>
4	FBK single pixel	3 × 10 <sup>10</sup>

# Radiation damage for 240 MeV Protons

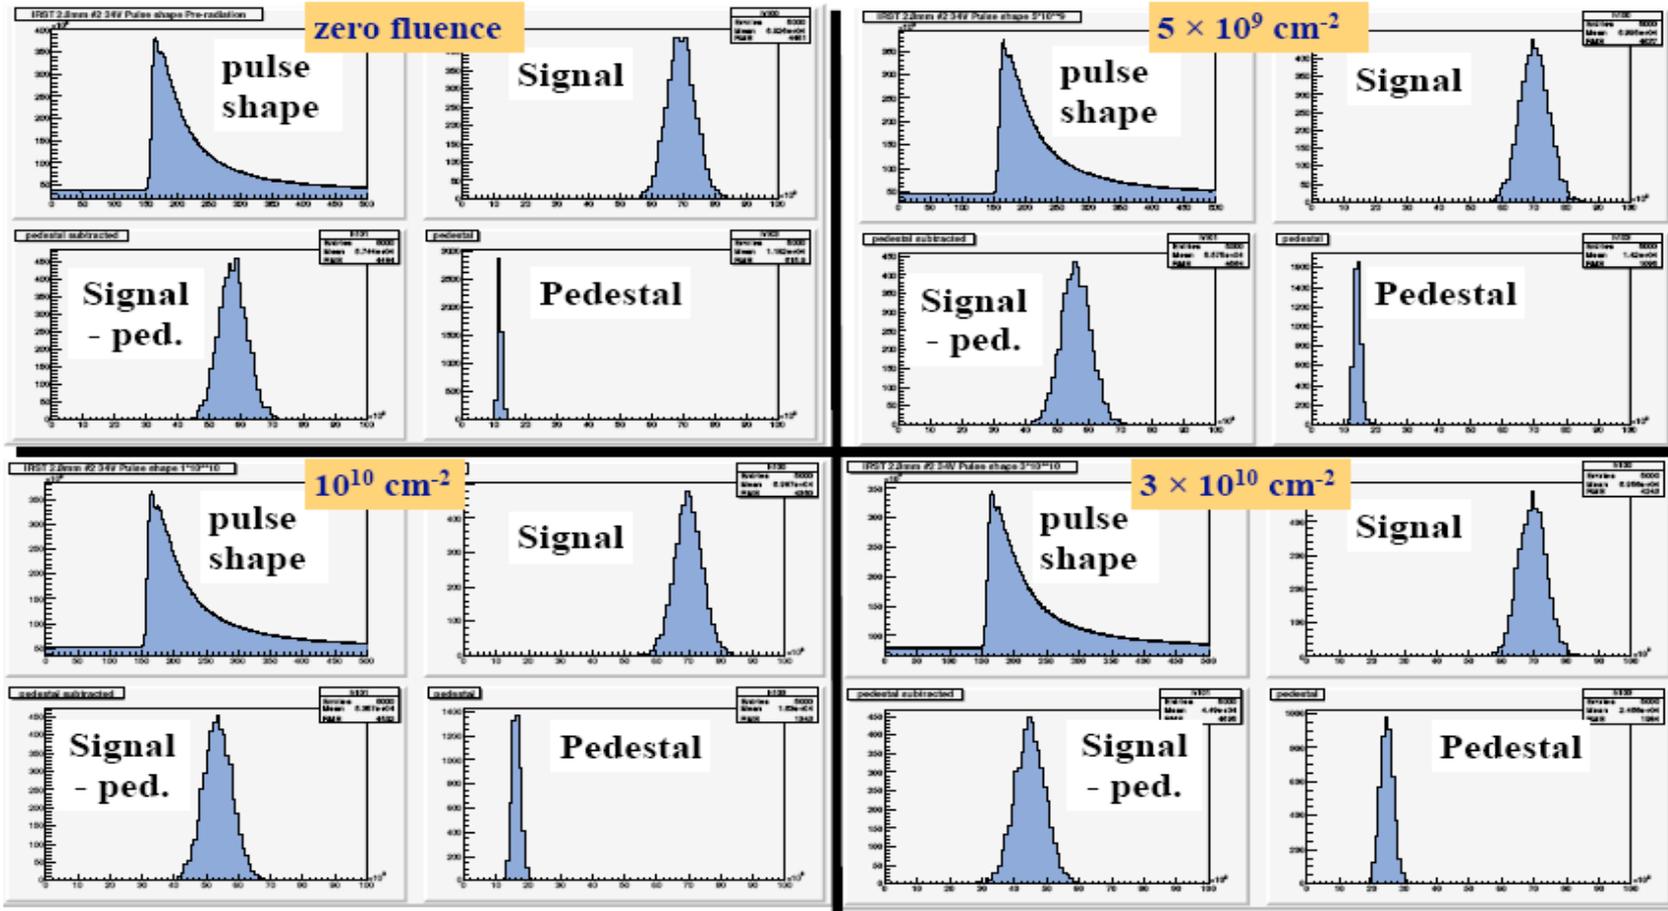

## Custom 6 mm<sup>2</sup> FBK SiPM

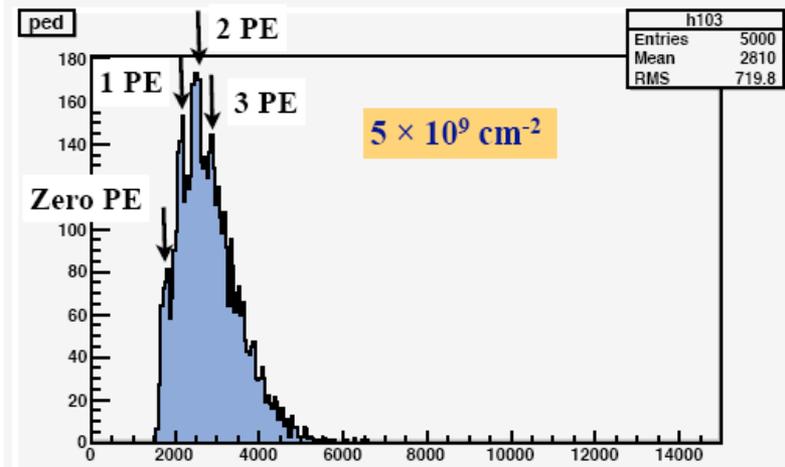

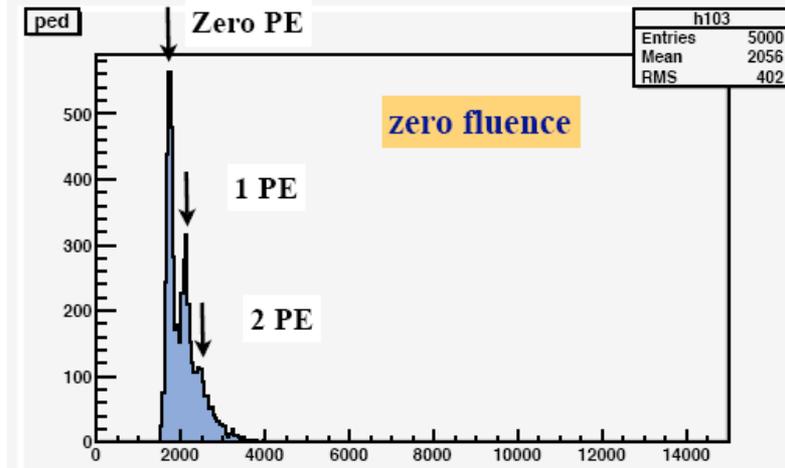

# Scope traces during radiation

## FBK 2.8 mm

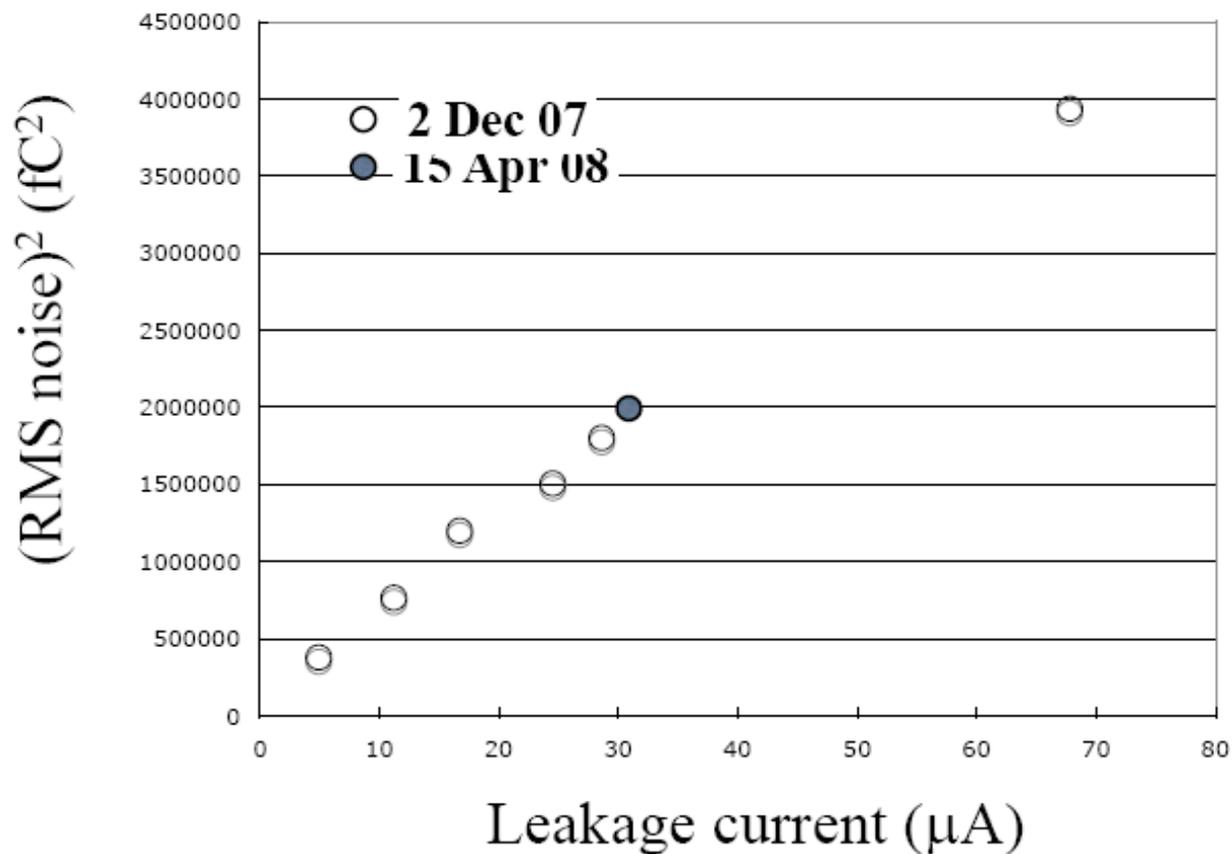

# 1mm<sup>2</sup> diodes

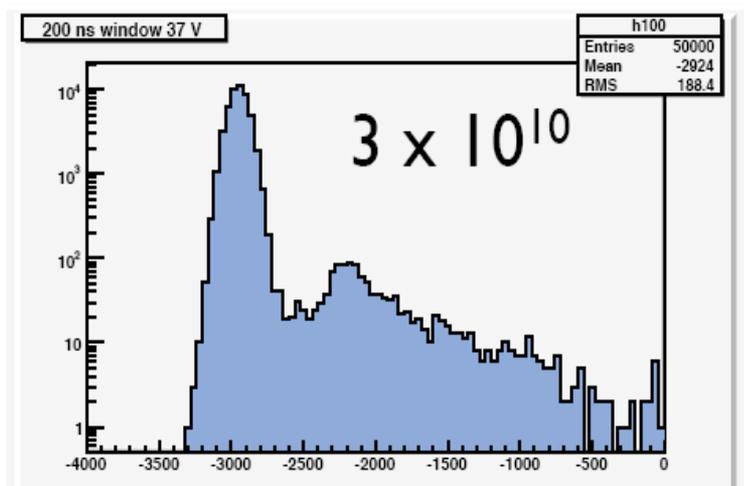

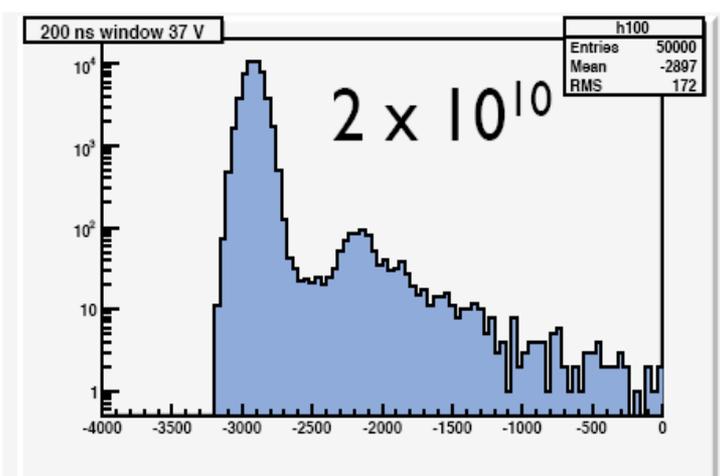

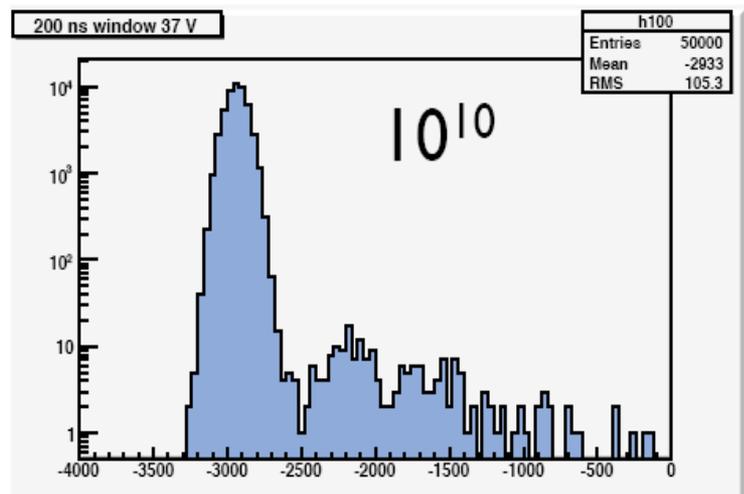

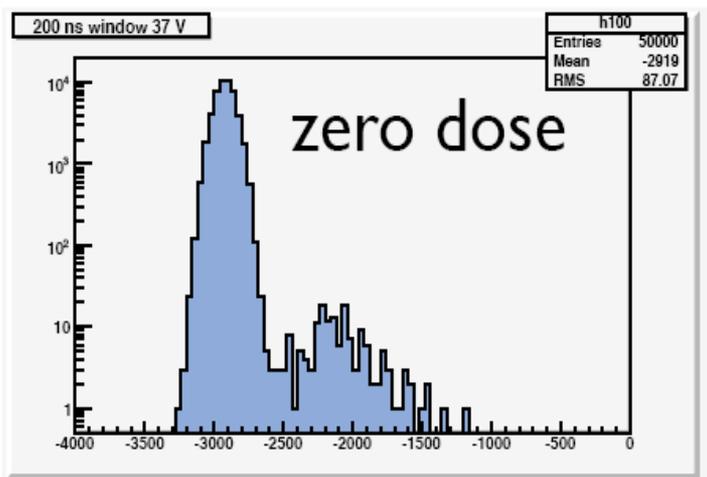

# I\_leakage vs Ped\_rms

**FBK 2.8 mm**

# FBK single cel single PE (pedestal distributions)

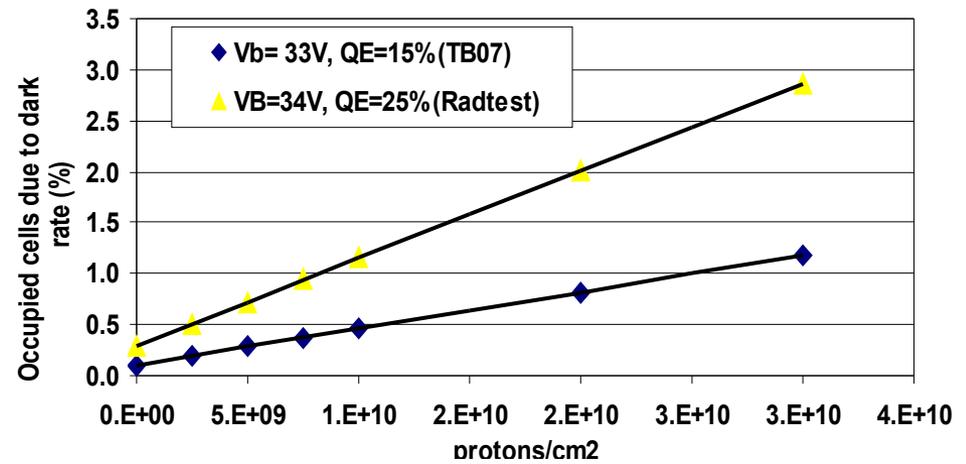

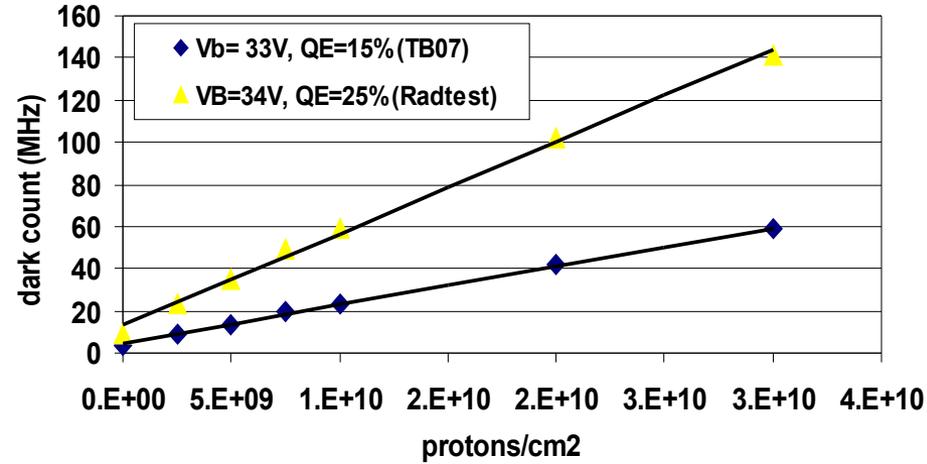

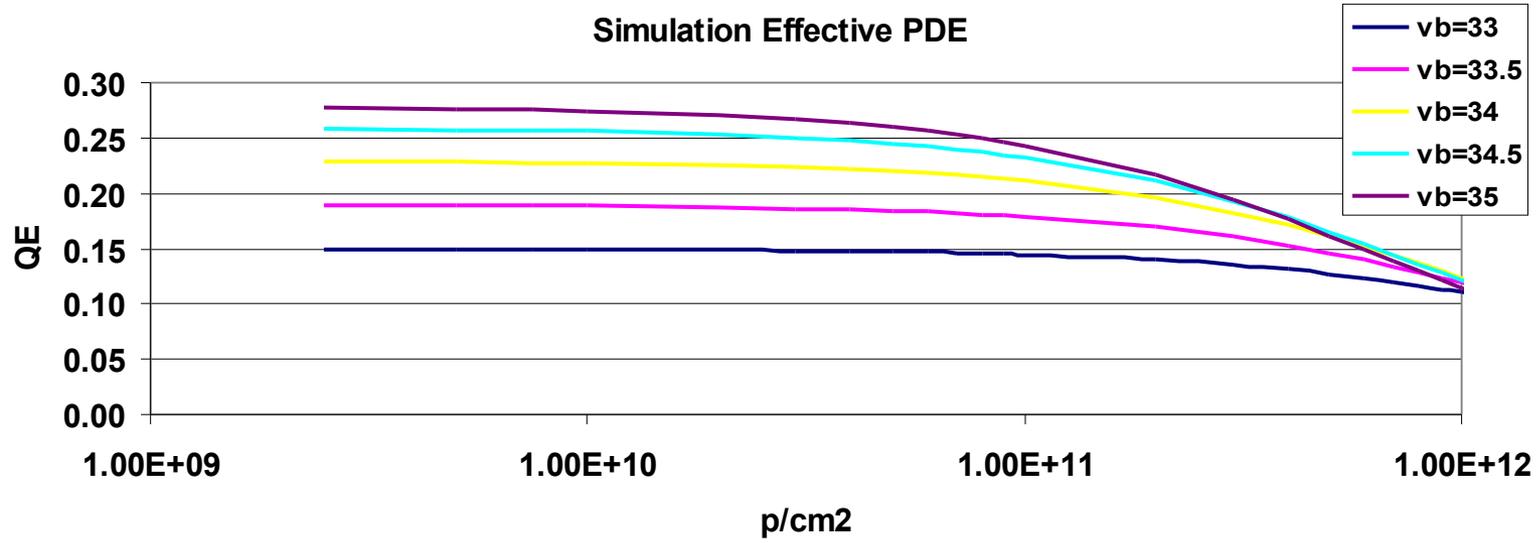

# Damage and QE (one day annealing) T=27 degree C

### Dark Count

### PDE loss due to high darkcount (cell recovery =500 ns)

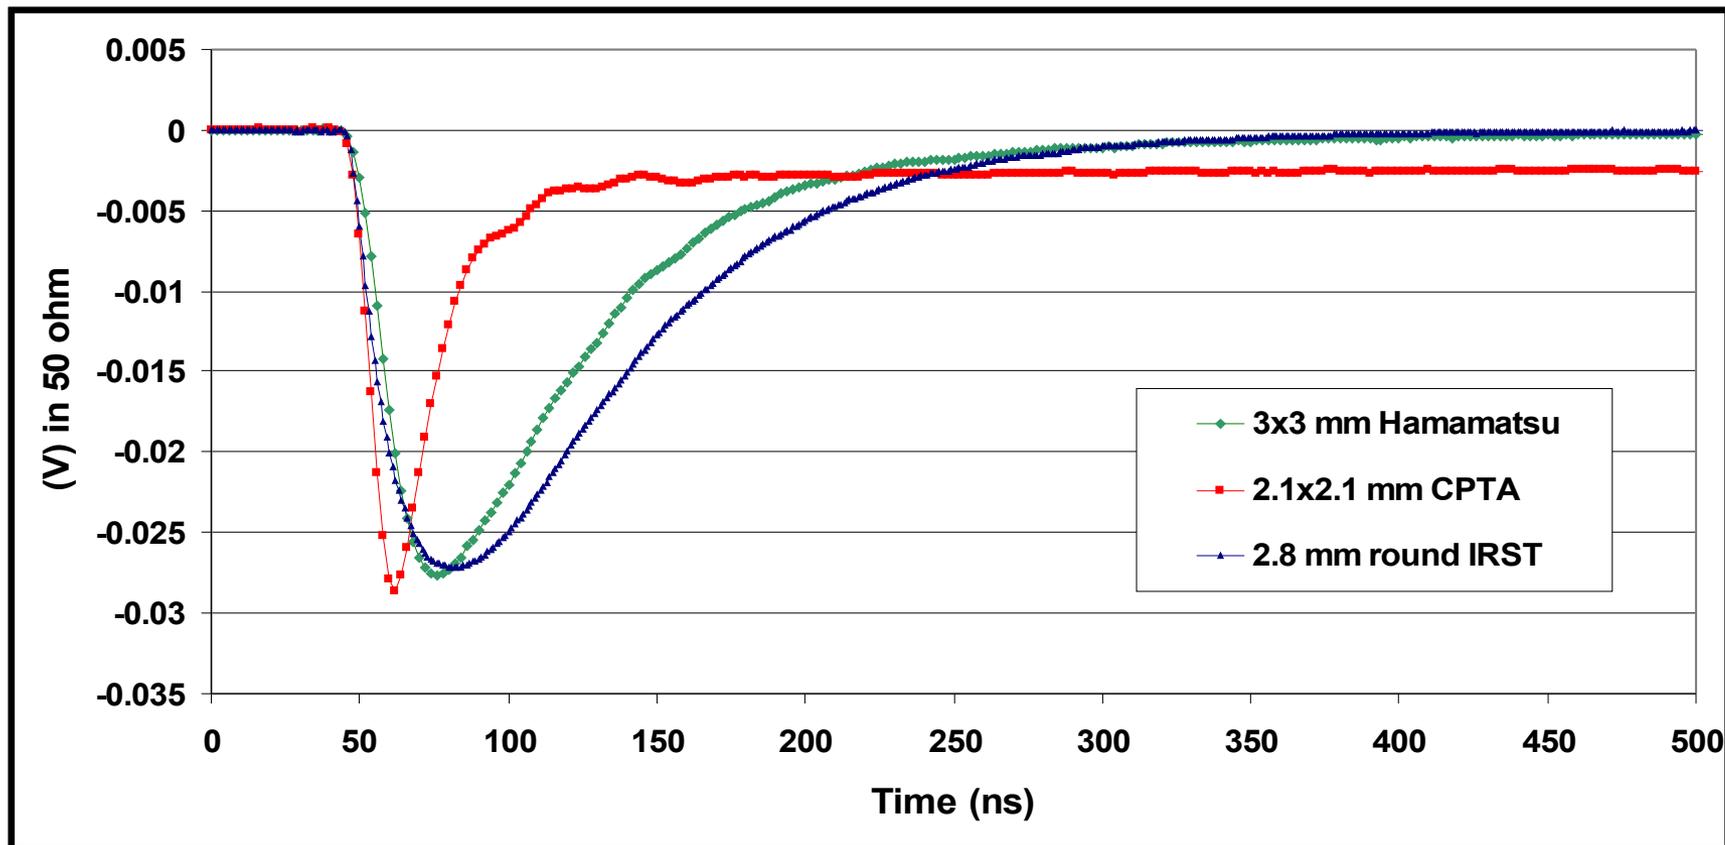

### Simulation Effective PDE

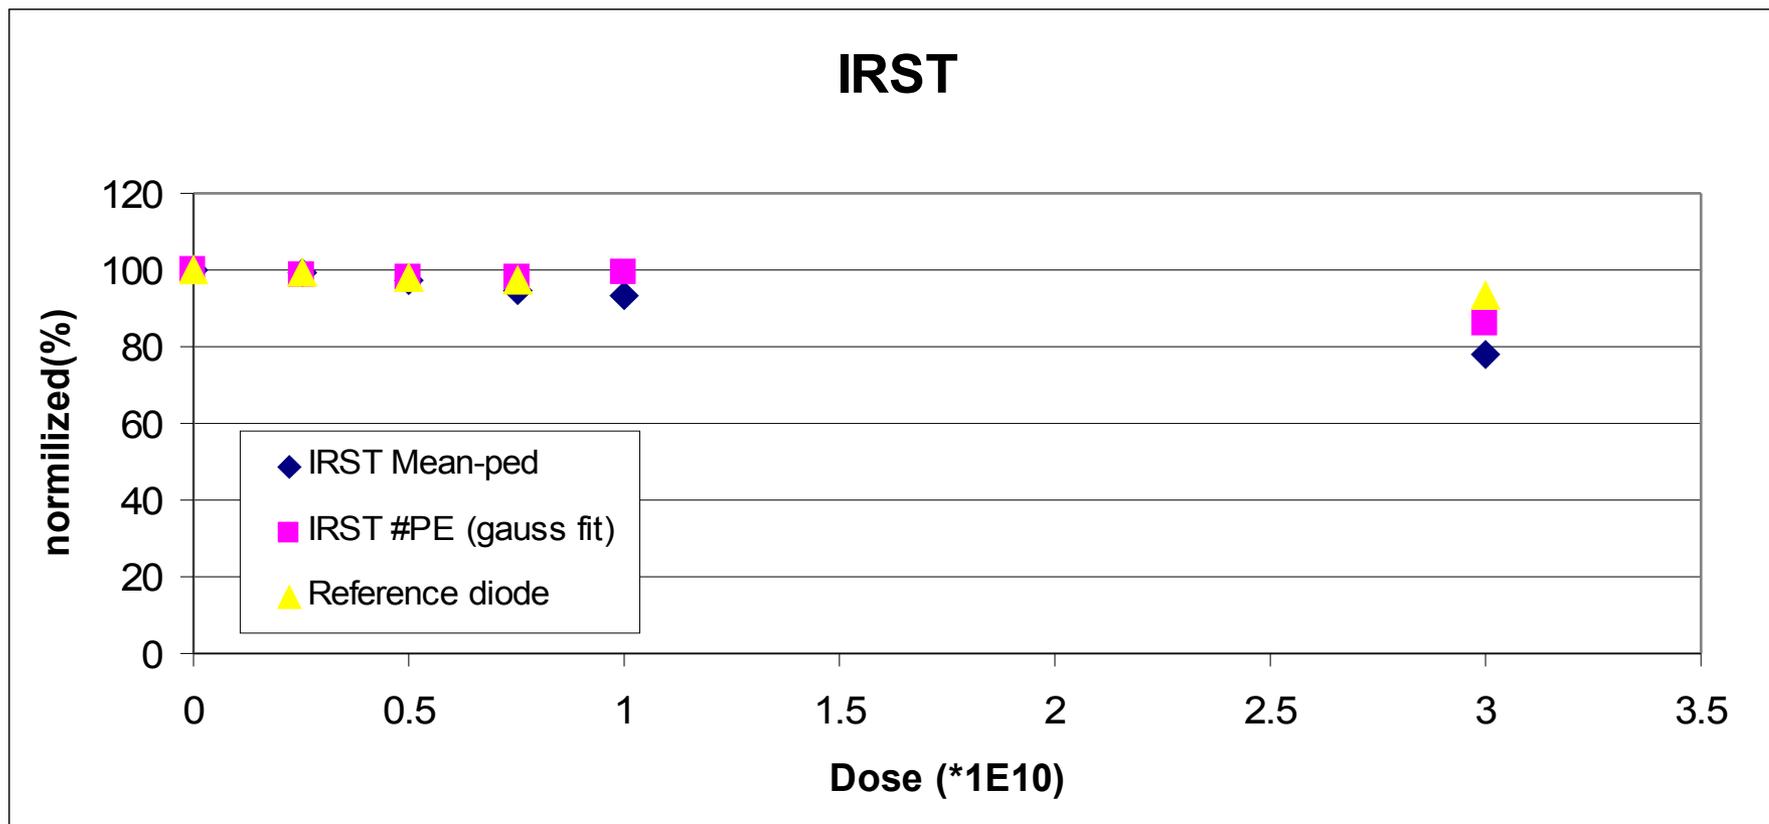

# Dead time of micro cells

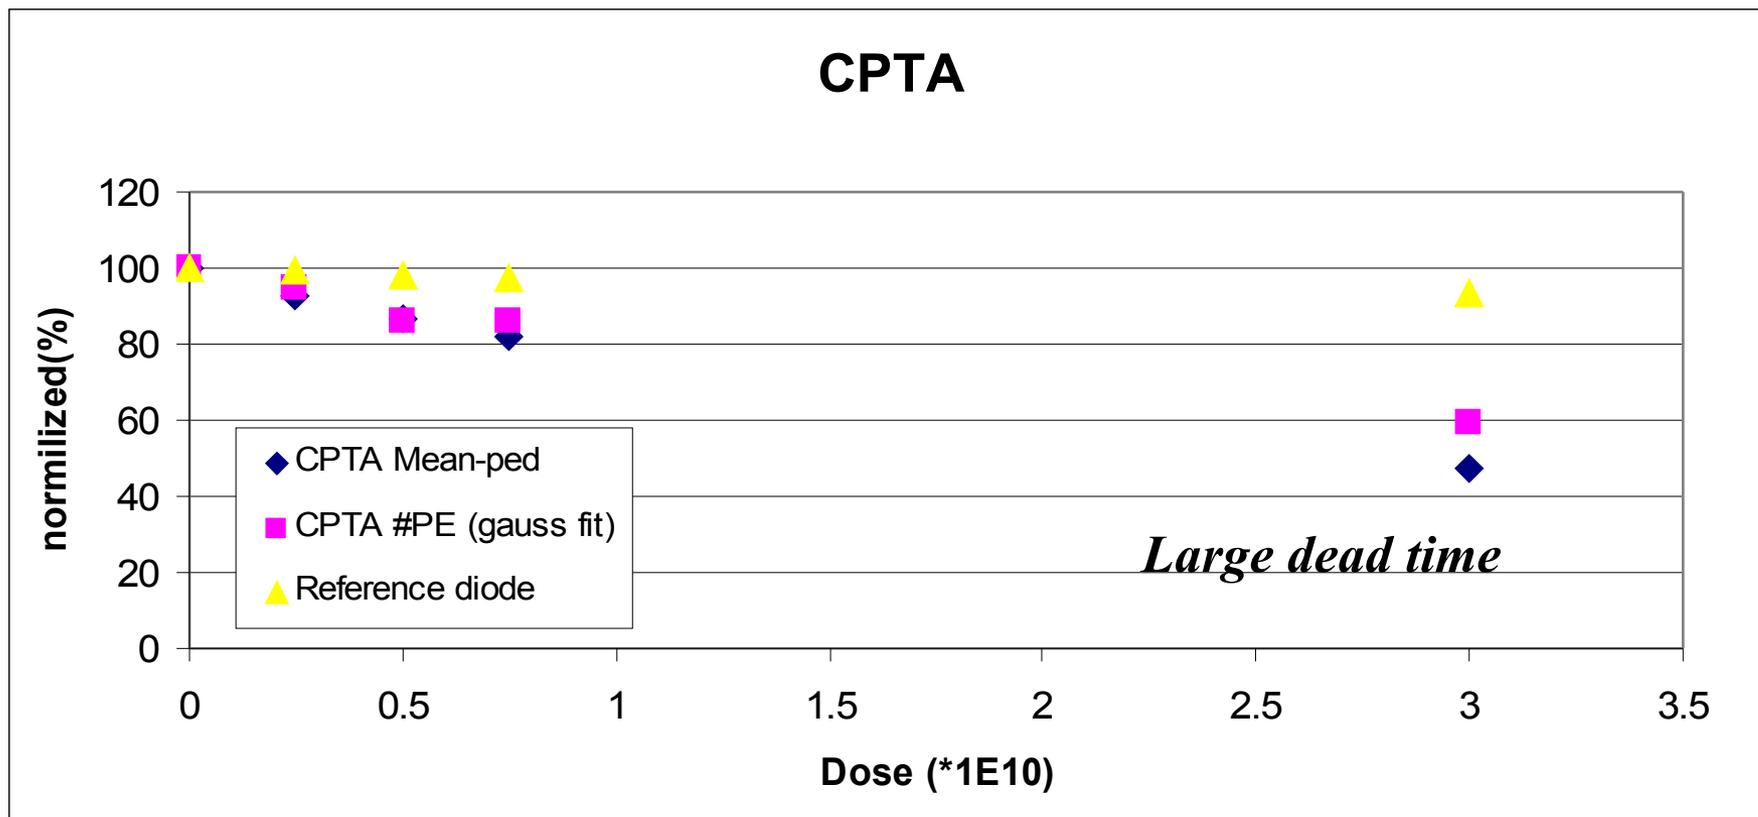

# Signal –Pedestal during radiation

# Signal –Pedestal during radiation

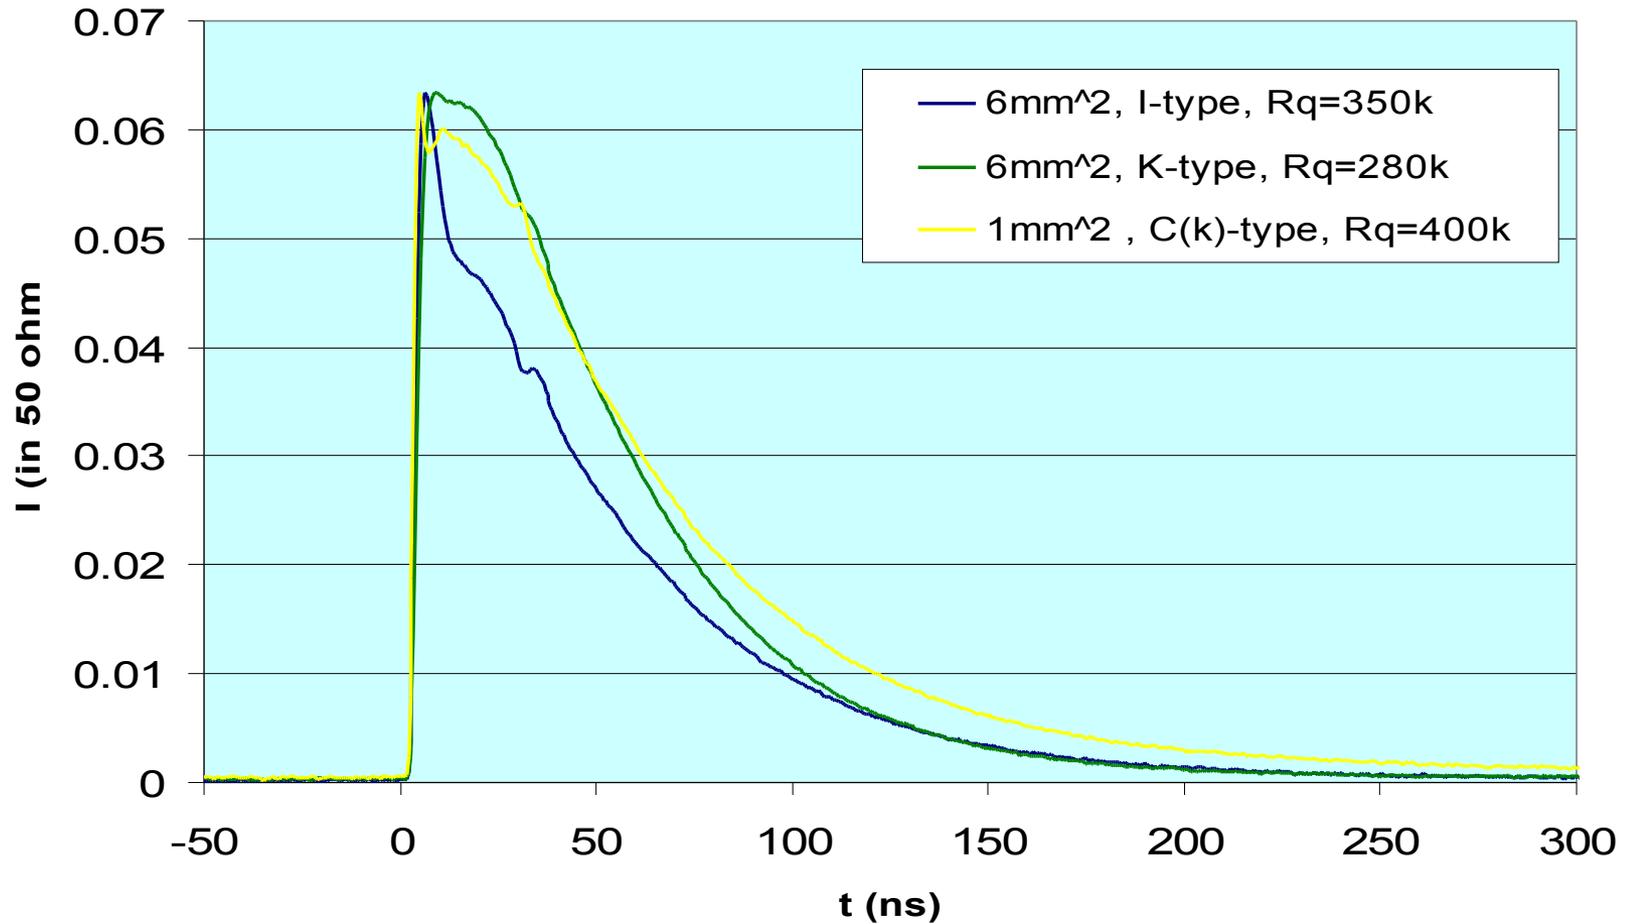

## Radiation levels in HCAL

- HB –  $10^{10}$  n/cm<sup>2</sup>/ CMS Year
- HE –  $3 * 10^{10}$  n/cm<sup>2</sup>/ CMS Year
- HO –  $10^9$  n/cm<sup>2</sup>/ CMS Year
- HF –  $10^{11}$  n/cm<sup>2</sup>/ CMS Year

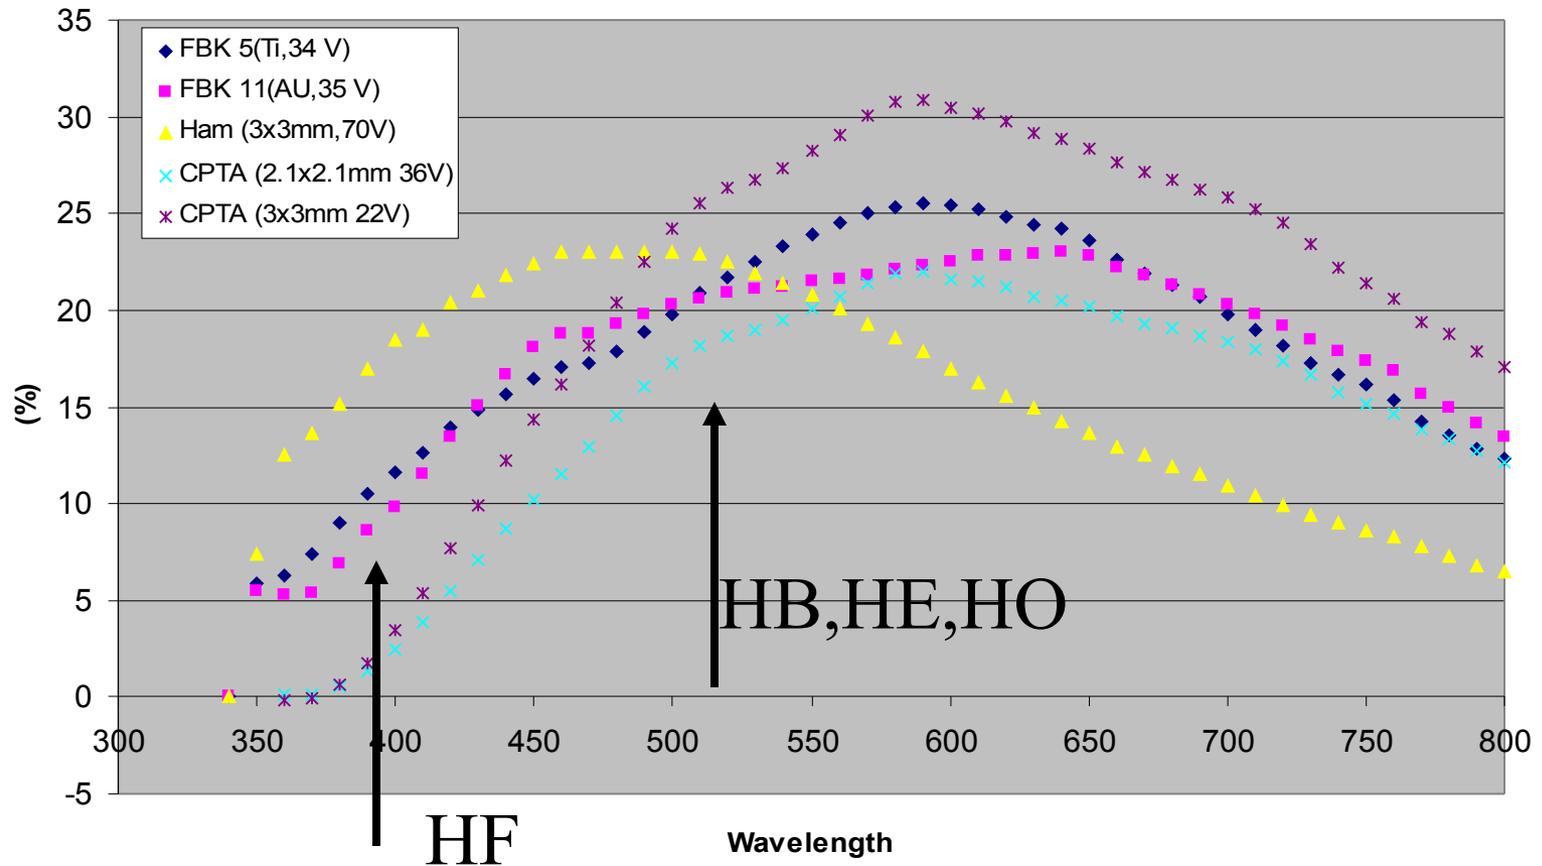

# Dead time shorter??

# PDE vs Company

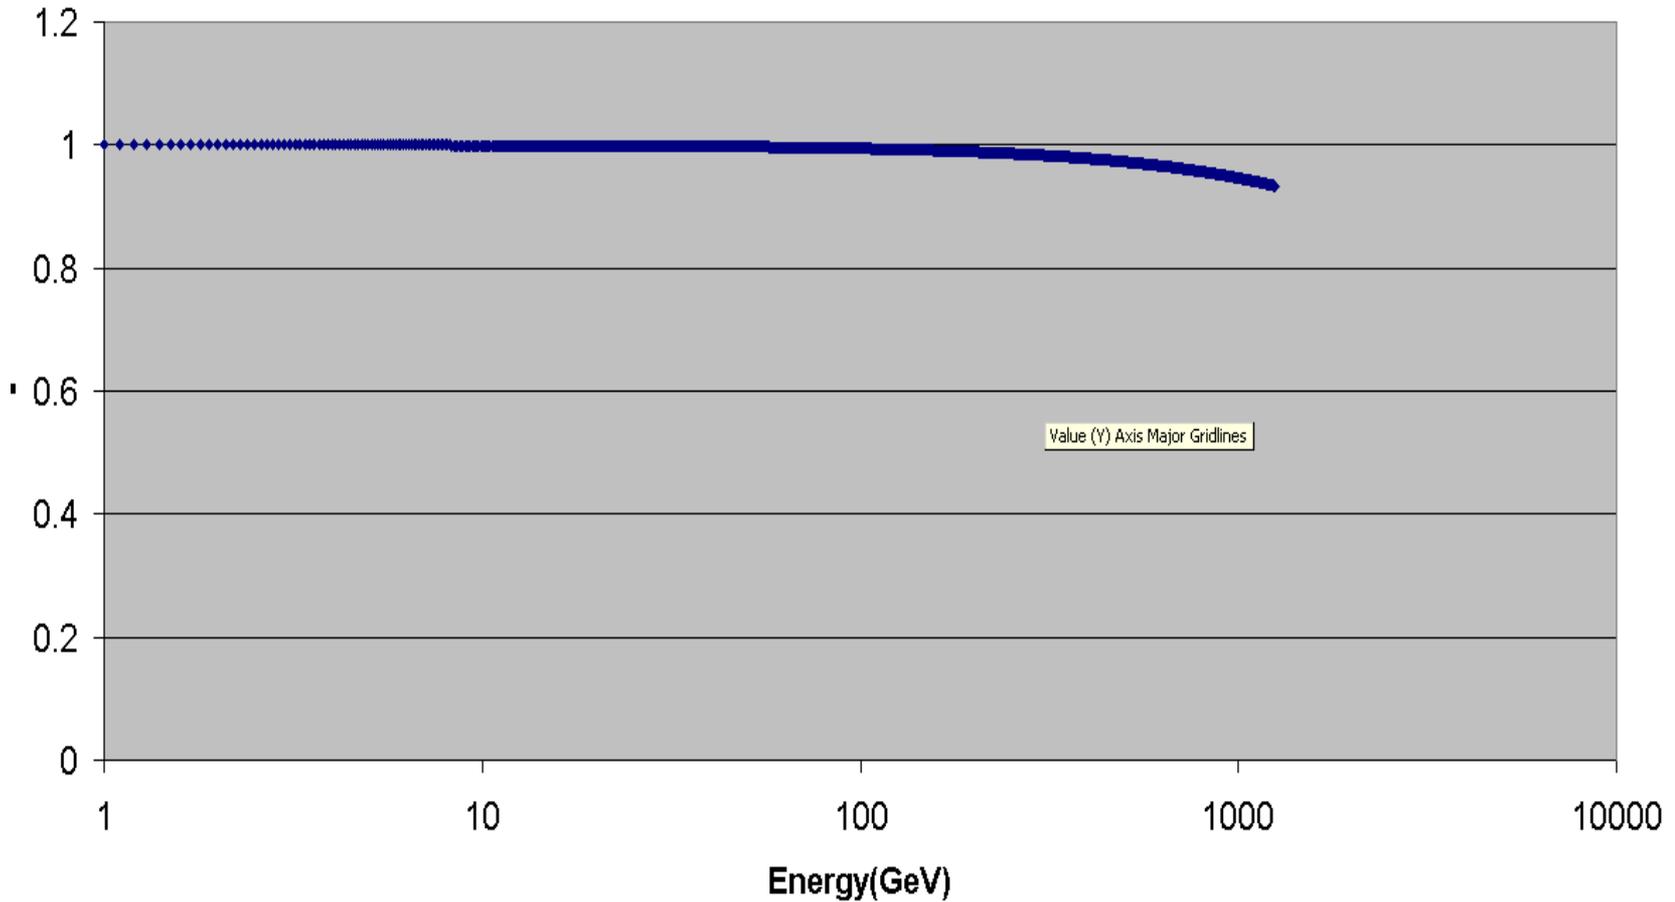

PDE at ~3 volt overvoltage

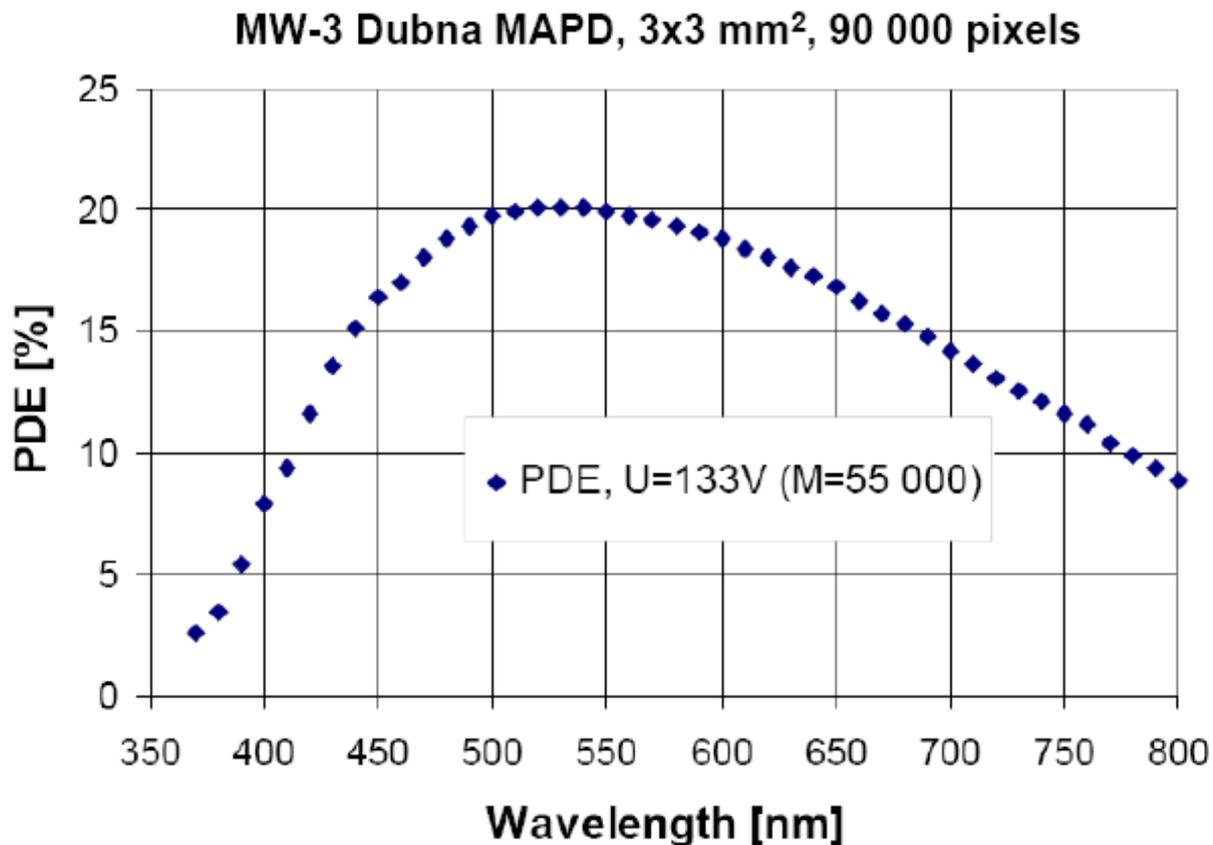

# Smaller cells vs Linearity (deadtime!)

Linearity for 10 micron cell in HB (20 p.e./MIP)

# New devices with 10 micron cells

*I. Musienko*
